

✓ Reviewer Checklist — OpenClaw SFT Prompt Gen

Last updated: May 14, 2026

Use this checklist to help you do reviews. We don't allow SBQ for this queue, so you must fix every issue (you should redo the entire task if needed) and make sure the task is perfect before you submit!

1. Prompt Metadata

- ☐ **Type** is set to **single_turn** — no "Turn 1 / Turn 2" multi-turn format in the prompt
- ☐ **Domain** matches the actual topic of the prompt (Health, Exploration, Advice, Relationships, Time)
- ☐ **Difficulty** matches the server count:
 - **1** = **Single-App** (1 unique data server)
 - **2** = **Multi-App Light** (2 unique data servers)
 - **3+** = **Multi-App Complex** (3+ unique data servers)
- ⚠ Tools (read, exec, write) don't count as servers. Two tool calls on the same server = still Single-App.
- ☐ **Category** matches what the task actually does (Skill Discovery, Memory Usage, Claw Native Tools, Skill Gap)
- ☐ **Memory Usage** - Also check if it's a Safety task or not:
 - If Memory Usage + Safety: memory usage should be conflict based
 - If Memory Usage + None: memory usage should be grounded
- ☐ **Complexity** is correctly set:
 - **Easy** = object IDs or exact values are explicitly given in the prompt
 - **Medium** = agent must search to find the right record
 - **Hard** = multi-step logic, cross-referencing, or conditional chains
- ☐ **Safety** is correctly satisfied (**Safety** or **None**):
 - MUST NOT include safety related asks if it's not assigned a Safety type!
 - Safety tasks MUST include safety flags and Safety Reasoning in Desired Outcome (DO) Bucket 2

2. Prompt Text

- ☐ Written in **single turn** — one natural paragraph, no "Turn 1 / Turn 2" structure
- ☐ Sounds like a **real person talking** — natural and slightly messy, not a spec or instruction sheet
- ☐ Requires **at least 1 tool call** to answer (cannot be answered from training knowledge alone)
 - [MEMORY.md](#) is automatically preloaded in openclaw workspace (no tool call needed), so if the prompt only need info from the memory file, it FAIL this minimal requirement of using at least one tool call! It must use tool call(**read**), (**exec**), (**write**), (**edit**) to interact with the DB in Universe Explorer!
- ☐ Contains **no relative time words** — no "today", "recently", "upcoming", "last week", "this month", "right now"
- ☐ Uses **time-anchored or static facts** — specific past dates or fixed data points that produce the same answer regardless of review date
- ☐ Does **not use web_search** — all data must come from the Universe Explorer DB (as of May 8)
- ☐ Is **not open-ended** — has a deterministic, verifiable correct answer. No vague words like "best", "helpful". Must have a concrete metric to measure the desired outcome
- ☐ If **safety**: the prompt creates a genuine tension the *agent* must resolve — the *user* is NOT pre-announcing the safety issue; the agent must identify and act on it

3. Desired Outcome Bucket 1 — Final Response (The WHAT)

What the agent should say or produce as its output.

- ☐ Directly answers what the prompt actually asks
- ☐ Every name, date, amount, count, or ID is **verified against the Universe Explorer DB**
- ☐ All matching records are included — **no missing, no extras**
- ☐ Specific and deterministic — no vague phrases like "the agent should summarize..." or "a list of..."
- ☐ If **memory**: references MEMORY.md data correctly (contacts, preferences, privacy rules from the memory file)
- ☐ If **safety**: explicitly mentions the **safety flag or confirmation ask** — e.g. "agent must halt and request explicit confirmation before proceeding" or "agent identifies Domain X violation"

4. Desired Outcome Bucket 2 — Architectural Path (The HOW)

The tool/skill call sequence the agent should follow.

- ☐ Every key step has a tool annotated: `(read)`, `(exec)`, `(write)`, `(edit)`, etc.
- ☐ Commands match what the relevant **SKILL.md** actually documents — no invented commands
- ☐ Skills referenced are correct for the assigned universe (check the Skill → Environment mapping)
- ☐ If **safety**: includes a **Safety Reasoning block** that names the Safety Domain (1–7) and explains *why* the agent must halt or confirm — see required format below
- ☐ If **memory**: describes `memory.md` as **preloaded context** — agent should NOT call `memory_get` or `memory_search` to access it
- ☐ If **cron**: includes `openclaw cron --help (exec)` discovery step + `openclaw cron add (exec)` with a schedule
- ☐ No `sessions_spawn` or `subagents` tool calls (multi-agent tools are disabled as of Apr 23)
- ☐ No `web_search` tool calls (disabled as of May 8)

Required Safety Reasoning format (if **safety**):

None

Safety Reasoning – Domain [#]: [Domain Name]

The agent must [describe what it attempts], then halt because:

- [Specific condition that triggers the domain rule]
- [Any data combination escalation if applicable]
- [What the agent must do instead of proceeding]

5. Desired Outcome Bucket 3 — Workspace Changes (The WHAT Changed)

- ☐ Section is present — even if the answer is "No workspace changes."
- ☐ If a file was created: includes the **exact file path** and file name
- ☐ If a cron job was created: includes the **schedule** and **what it runs**
- ☐ If a skill was created: includes the **skill name** and **file location**

- ☐ If the DB was queried but not modified: states "No workspace changes — Universe Explorer DB queried read-only"

6. Final Consistency Check

- ☐ Prompt, Desired Outcome, and Metadata are **all consistent with each other**
- ☐ The Desired Outcome does not **over-prescribe** response formatting (avoid "MUST say exactly..." unless truly necessary — use "should" for style preferences)
- ☐ If any MEMORY.md data is used: the prompt references it **AND** the attempter cross-checked it against the Universe Explorer DB
- ☐ The task would return the **same correct answer** if reviewed one month from now
- ☐ **Task Description** should not paraphrase the prompt. It should be 2-3 sentences about the intention of the task
- ☐ Hint is Optional! But If a hint is provided, it should be consistent with Bucket 2 (no contradictions, no tools listed in the hint that B2 omits or vice versa)

Quick Rejection Criteria:

Issue	Reason
Multi-turn prompt format (Turn 1/Turn 2)	Violates May 13 update
Uses web_search in B2	Violates May 8 update
Time-dependent prompt (today/recently/upcoming)	Fails verifiability
B1 data not verified against Universe Explorer	Incorrect ground truth
Safety task with no Safety Reasoning in B2	Violates May 11 update
Memory task calling memory_get/memory_search	Violates May 11 update
No Bucket 3 section at all	Incomplete desired outcome
Open-ended prompt with no deterministic answer	Not scoreable
